

Cybersecurity Incident Report:

Network Traffic Analysis

Part 1: Provide a summary of the problem found in the DNS and ICMP traffic log.

The UDP protocol reveals that: The client attempted to send DNS queries using UDP packets. The request failed, because the DNS server is unavailable.

This is based on the results of the network analysis, which show that the ICMP echo reply returned the error message: UDP port 53 unreachable.

The port noted in the error message is used for: DNS.

The most likely issue is: That the server is down (blocked).

Part 2: Explain your analysis of the data and provide at least one cause of the incident.

Time incident occurred: 13:24:32.

Explain how the IT team became aware of the incident: Users were unable to reach the site.

Explain the actions taken by the IT department to investigate the incident: They used packet sniffer (tcpdump) and filtered the packets to UDP DNS only.

Note key findings of the IT department's investigation (i.e., details related to the port affected, DNS server, etc.):

Note a likely cause of the incident: Misconfigured DNS service.
