

Parking lot USB exercise

Contents	Write 2-3 sentences about the types of information found on this device. <i>The USB device contains both personal and work-related files, including documents with employee information, internal hospital reports, and possibly patient-related data. Some files contain personally identifiable information (PII), such as names, contact details, identification numbers, or payroll information. Storing personal files together with sensitive work files is not safe because it increases the risk of accidental disclosure and violates proper data handling practices.</i>
Attacker mindset	Write 2-3 sentences about how this information could be used against Jorge or the hospital. <i>An attacker could use the information on the device to conduct phishing or social engineering attacks against Jorge or other hospital employees. If patient or financial data is present, it could be exploited for identity theft, fraud, or extortion. Information such as login details, internal documents, or contact lists could provide access to hospital systems or help an attacker target employees' relatives to gain leverage.</i>
Risk analysis	Write 3 or 4 sentences describing technical, operational, or managerial controls that could mitigate these types of attacks: <i>USB devices can contain malicious software such as ransomware, spyware, keyloggers, or trojans. If the infected device had been connected directly to the hospital network, malware could have spread, resulting in data breaches, operational disruption, or system downtime. Sensitive information on such a device could include employee credentials, patient records, or internal network documentation. To mitigate these risks, the hospital should enforce strict removable media policies, disable automatic USB execution, require endpoint protection and antivirus scanning, conduct employee security awareness training, and implement technical controls such as network segmentation and least privilege access.</i>
